What is Blockchain Technology?

11

2

224

"The practical consequence [...] for the first time, a way for one Internet user to transfer a unique piece of digital property to another Internet user, such that the transfer is guaranteed to be safe and secure, everyone knows that the transfer has taken place, and nobody can challenge the legitimacy of the transfer. The consequences of this breakthrough are hard to overstate."

- Marc Andreessen

From a cruising altitude, a blockchain might not look that different from things you're familiar with, say Wikipedia.

With a blockchain, many people can write entries into a record of information, and a community of users can control how the record of information is amended and updated. Likewise, Wikipedia entries are not the product of a single publisher. No one person controls the information.

Descending to ground level, however, the differences that make blockchain technology unique become more clear. While both run on distributed networks (the internet), Wikipedia is built into the World Wide Web (WWW) using a client-server network model.

A user (client) with permissions associated with its account is able to change Wikipedia entries stored on a centralized server.

Whenever a user accesses the Wikipedia page, they will get the updated version of the 'master copy' of the Wikipedia entry. Control of the database remains with Wikipedia administrators allowing for access and permissions to be maintained by a central authority.

Wikipedia's digital backbone is similar to the highly protected and centralized databases that governments or banks or insurance companies keep today. Control of centralized databases rests with their owners, including the management of updates, access and protecting against cyber-threats.

The distributed database created by blockchain technology has a fundamentally different digital backbone. This is also the most distinct and important feature of blockchain technology.

What the Financial Impact of Bitcoin Technology Will Be

LedgerX and the SEC's Turf War

Wikipedia's 'master copy' is edited on a server and all users see the new version. In the case of a blockchain, every node in the network is coming to the same conclusion, each updating the record independently, with the most popular record becoming the de-facto official record in lieu of there being a master copy.

Transactions are broadcast, and every node is creating their own updated version of events.

It is this difference that makes blockchain technology so useful – It represents an innovation in information registration and distribution that eliminates the need for a trusted party to facilitate digital relationships.

Yet, blockchain technology, for all its merits, is not a new technology.

Rather, it is a combination of proven technologies applied in a new way. It was the particular orchestration of three technologies (the Internet, private key cryptography and a protocol governing incentivization) that made bitcoin creator Satoshi Nakamoto's idea so useful.

Blockchains are built from 3 technologies		
1. Private Key Cryptography	2. P2P Network	3. Program (the blockchain's protocol)
Cash vs. Plastic	Tree falls in a forest	Tragedy of the commons
Identity	System of Record	Platform

The result is a system for digital interactions that does not need a trusted third party. The work of securing digital relationships is implicit — supplied by the elegant, simple, yet robust network architecture of blockchain technology itself.

Defining digital trust

Trust is a risk judgement between different parties, and in the digital world, determining trust often boils down to proving identity (authentication) and proving permissions (authorization).

Put more simply, we want to know, 'Are you who you say you are?' and 'Should you be able to do what you are trying to do?'

In the case of blockchain technology, private key cryptography provides a powerful ownership tool that fulfills authentication requirements. Possession of a private key is ownership. It also spares a person from having to share more personal information than they would need to for an exchange, leaving them exposed to hackers.

Authentication is not enough. Authorization – having enough money, broadcasting the correct transaction type, etc – needs a distributed, peer-to-peer network as a starting point. A distributed network reduces the risk of centralized corruption or failure.

This distributed network must also be committed to the transaction network's recordkeeping and security. Authorizing transactions is a result of the entire network applying the rules upon which it was designed (the blockchain's protocol).

Authentication and authorization supplied in this way allow for interactions in the digital world without relying on (expensive) trust. Today, entrepreneurs in industries around the world have woken up to the implications of this development – unimagined, new and powerful digital relationships are possible. Blockchain technology is often described as the backbone for a transaction layer for the Internet, the foundation of the Internet of Value.

In fact, the idea that cryptographic keys and shared ledgers can incentivize users to secure and formalize digital relationships has imaginations running wild. Everyone from governments to IT firms to banks is seeking to build this transaction layer.

Authentication and authorization, vital to digital transactions, are established as a result of the configuration of blockchain technology.

The idea can be applied to any need for a trustworthy system of record.

NEXT: HOW DOES BLOCKCHAIN TECHNOLOGY WORK?

INDEX: A BEGINNERS GUIDE TO BITCOIN AND BLOCKCHAIN TECHNOLOGY

What is Bitcoin?	It's a decentralized digital currency
Why Use Bitcoin?	It's fast, cheap to use, and secure
How Can I Buy Bitcoins?	From an exchange or an individual
How to Buy Bitcoin in the UK	Buying bitcoin in the UK
How to Store Your Bitcoins	Use a digital or paper wallet
What Can You Buy with Bitcoin?	Spend your bitcoins
How to Sell Bitcoin	A guide on how to sell your bitcoins
How to Accept Bitcoin Payments for Your Store	Learn about bitcoin POS systems
How do Bitcoin Transactions Work?	Bitcoin addresses and private keys
Is Bitcoin Legal?	The current regulation around bitcoin
Who is Satoshi Nakamoto?	The founder of bitcoin
How Bitcoin Mining Works	By confirming transactions
How to Set Up a Bitcoin Miner	Generate bitcoins yourself
What are Bitcoin Mining Pools?	What are pools how and how to join them?
How Does Cloud Mining Bitcoin Work?	Alternative bitcoin mining solutions
How to Calculate Mining Profitability	Can you make a ROI?
How to Make a Paper Bitcoin Wallet	Creating an unhackable bitcoin wallet

What is the Difference Between Litecoin and Bitcoin?	It's the silver to bitcoin's gold
How to Buy Litecoin	How to buy the bitcoin alternative litecoin
How to Mine Litecoin and other Altcoins	How to generate your own altcoins
Understanding Bitcoin Price Charts	A primer on bitcoin price charts
Bitcoin E-Commerce Services for Merchants	How to accept bitcoin at your business
What is Blockchain Technology?	A system of distributed data and logic
How Does Blockchain Technology Work?	Cryptographic keys, distributed networks and network servicing protocols
What Can a Blockchain Do?	Identity, recordkeeping, smart contracts and more
What is a Distributed Ledger?	A dynamic, independently maintained database
What is the Difference Between Public and Permissioned Blockchains?	Can anyone read or write to the ledger?
What is the Difference Between a Blockchain and a Database?	It begins with architectural and administrative decisions
What Are the Applications and Use Cases of Blockchains?	Tokenization, auditing, governance, settlement and more
How Could Blockchain Technology Change Finance?	Cross-border payments, new asset classes, regulatory compliance and more
What are Blockchain's Issues and Limitations?	Complexity, size, costs, speed, security, politics and more
Why Use a Blockchain?	To manage and secure digital relationships as part of a system of record
What is Ethereum?	A blockchain application platform and 'world computer'
What is Ether?	The 'fuel' of the ethereum network
How to Use Ethereum	Wallets, trading and 'dapps'
Who Created Ethereum?	Vitalik Buterin
How Ethereum Mining Works	'Proof of Work' and 'Proof of Stake'
How to Mine Ethereum	GPUs, mining software and pools
How Ethereum Works	'Turing-complete' programming, 'state' and the 'EVM'
What is a Decentralized Application?	A distributed 'smart contract' system
What is a DAO?	A 'decentralized autonomous organization'
How Do Ethereum Smart Contracts Work?	Code, transaction fees and 'gas'
How Will Ethereum Scale?	'Sharding' and 'off-chain' transactions
